

Manifold & Drip-Leg Heaters

Manifold and drip-leg heaters are used to heat and maintain the manifold piping at an elevated temperature in order to evaporate liquid chlorine and prevent re-liquefaction of chlorine gas. Heaters are critically important for all pressurized chlorine manifolds. If allowed to enter the vacuum regulator, liquid chlorine will damage the vacuum system components. Over time if liquid chlorine is allowed to collect in the manifold it will cause more rapid corrosion than chlorine gas alone, increasing the chances of a pressurized gas leak.

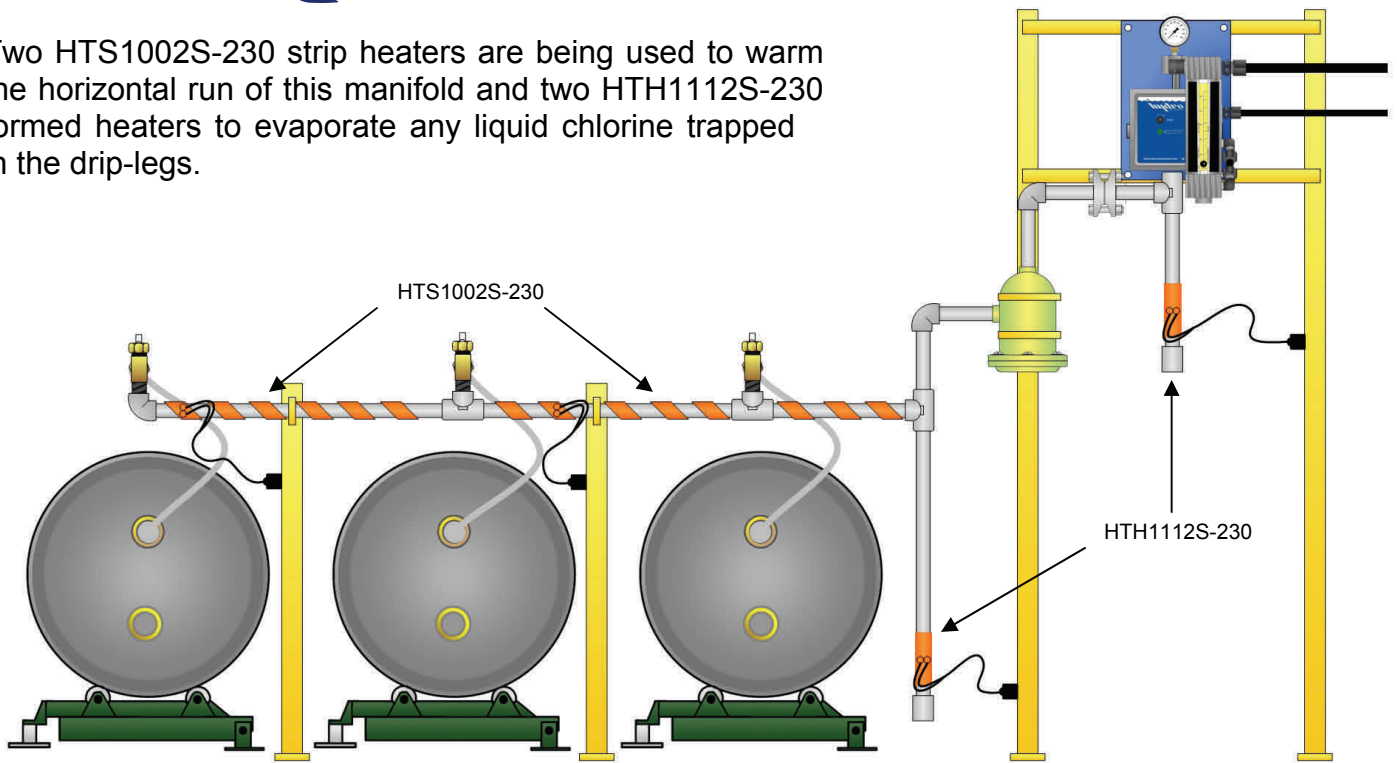

- A. Mounted strip heater—HTS1002S-230, 100cm long, includes two worm clamps for mounting
- B. Loose strip heater—HTS0502S-230, 50cm long
- C. Formed heater—HTH1112S-230 for dip-legs, attached with C clamps

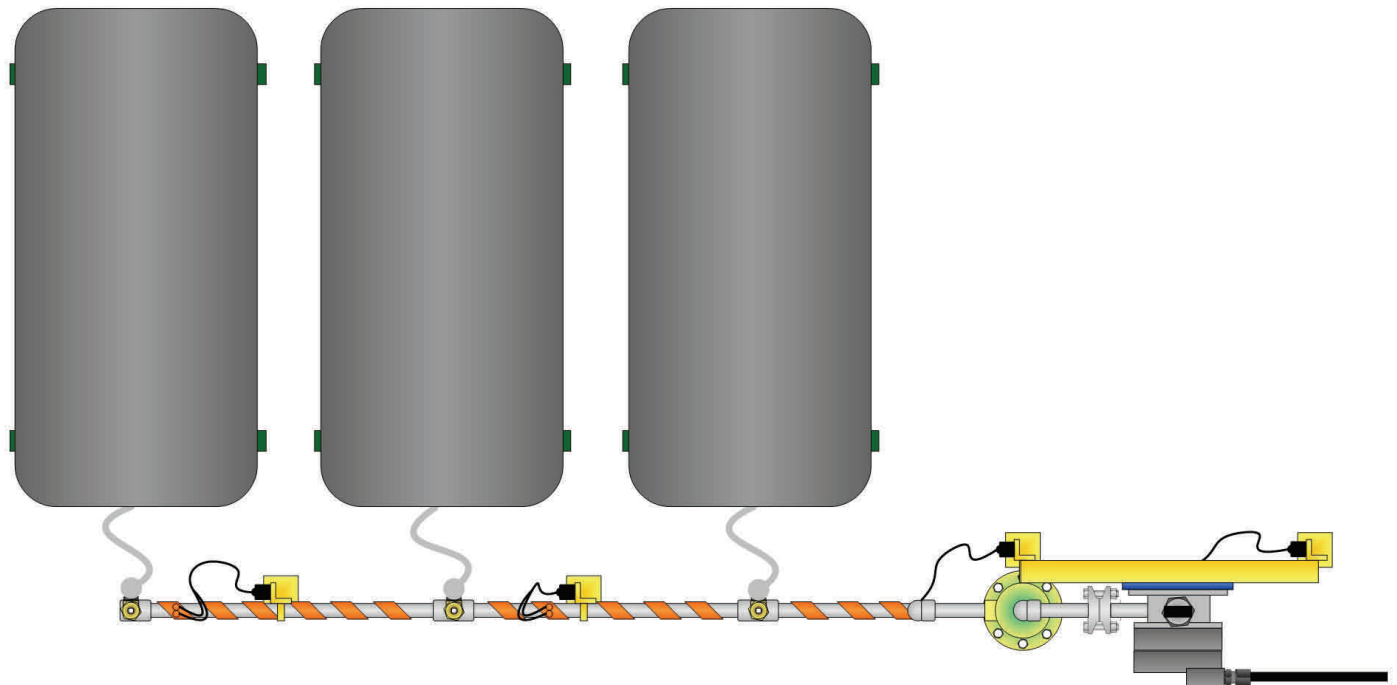

Heater Specifications

Part No.	Type	Dimensions	Power	Output	Thermostat	Clamps Provided
HTS0502S-230	Strip Heater	2.5 cm W x 50 cm L	230VAC 50/60Hz	15W	None	2x Worm Clamps
HTS1002S-230	Strip Heater	2.5 cm W x 100 cm L	230VAC 50/60Hz	20W	None	2x Worm Clamps
HTH1112S-110	Formed	2.7 cm ID x 9.8 cm L	110VAC 50/60Hz	25W	70° C Max	2x C Clamps
HTH1112S-230	Formed	2.7 cm ID x 9.8 cm L	230VAC 50/60Hz	25W	70° C Max	2x C Clamps
HTH1112S-024	Formed	2.7 cm ID x 9.8 cm L	24VDC	25W	70° C Max	2x C Clamps

Two HTS1002S-230 strip heaters are being used to warm the horizontal run of this manifold and two HTH1112S-230 formed heaters to evaporate any liquid chlorine trapped in the drip-legs.
